- 5 Summary

- Let  $V$  be a ground set of size  $n$ .

**Def.** A **priority queue** is an **abstract** data structure that maintains a set  $U \subseteq V$  of elements, each with an associated key value, and supports the following operations:

- $\text{insert}(v, \text{key\_value})$ : insert an element  $v \in V \setminus U$ , with associated key value  $\text{key\_value}$ .
- $\text{decrease\_key}(v, \text{new\_key\_value})$ : decrease the key value of an element  $v \in U$  to  $\text{new\_key\_value}$
- $\text{extract\_min}()$ : return and remove the element in  $U$  with the smallest key value
- ...

# Simple Implementations for Priority Queue

- $n$  = size of ground set  $V$

<b>data structures</b>	<b>insert</b>	<b>extract_min</b>	<b>decrease_key</b>
array

sorted array	$O(n)$	$O(1)$	$O(n)$
heap	$O(\lg n)$	$O(\lg n)$	$O(\lg n)$

# Heap

The elements in a heap is organized using a complete binary tree:

- Nodes are indexed as  $\{1, 2, 3, \dots, s\}$
- Parent of node  $i$ :  $\lfloor i/2 \rfloor$
- Left child of node  $i$ :  $2i$
- Right child of node  $i$ :  $2i + 1$

# Heap

A heap  $H$  contains the following fields

- $s$ : size of  $U$  (number of elements in the heap)
- $A[i], 1 \leq i \leq s$ : the element at node  $i$  of the tree
- $p[v], v \in U$ : the index of node containing  $v$
- $key[v], v \in U$ : the key value of element  $v$

- $s = 5$
- $A = ('f', 'g', 'c', 'e', 'b')$
- $p['f'] = 1, p['g'] = 2, p['c'] = 3, p['e'] = 4, p['b'] = 5$

# Heap

The following **heap property** is satisfied:

- for any two nodes  $i, j$  such that  $i$  is the parent of  $j$ , we have  $key[A[i]] \leq key[A[j]]$ .

A heap. Numbers in the circles denote key values of elements.

$\text{insert}(v, \text{key\_value})$

$\text{insert}(v, \text{key\_value})$

$\text{insert}(v, \text{key\_value})$

$\text{insert}(v, \text{key\_value})$

$\text{insert}(v, \text{key\_value})$

### insert( $v$ , $key\_value$ )

```
1:  $s \leftarrow s + 1$   
2:  $A[s] \leftarrow v$   
3:  $p[v] \leftarrow s$   
4:  $key[v] \leftarrow key\_value$   
5: heapify-up( $s$ )
```

### heapify-up( $i$ )

```
1: while  $i > 1$  do  
2:    $j \leftarrow \lfloor i/2 \rfloor$   
3:   if  $key[A[i]] < key[A[j]]$  then  
4:     swap  $A[i]$  and  $A[j]$   
5:      $p[A[i]] \leftarrow i$ ,  $p[A[j]] \leftarrow j$   
6:      $i \leftarrow j$   
7:   else break
```

`extract_min()`

`extract_min()`

`extract_min()`

sorted array	$O(n)$	$O(1)$	$O(n)$
heap	$O(\lg n)$	$O(\lg n)$	$O(\lg n)$

## Two Definitions Needed to Prove that the Procedures Maintain **Heap Property**

**Def.** We say that  $H$  is almost a heap except that  $key[A[i]]$  is too small if we can increase  $key[A[i]]$  to make  $H$  a heap.

**Def.** We say that  $H$  is almost a heap except that  $key[A[i]]$  is too big if we can decrease  $key[A[i]]$  to make  $H$  a heap.

- 5 Summary

# Encoding Letters Using Bits

- 8 letters  $a, b, c, d, e, f, g, h$  in a language
- need to encode a message using bits
- idea: use 3 bits per letter

$a$	$b$	$c$	$d$	$e$	$f$	$g$	$h$
000	001	010	011	100	101	110	111

$deacfg \rightarrow 011100000010101110$

**Q:** Can we have a better encoding scheme?

- Seems unlikely: must use 3 bits per letter

**Q:** What if some letters appear more frequently than the others?

**Q:** If some letters appear more frequently than the others, can we have a better encoding scheme?

**A:** Using **variable-length encoding scheme** might be more efficient.

### Idea

- using fewer bits for letters that are more frequently used, and more bits for letters that are less frequently used.

**Q:** What is the issue with the following encoding scheme?

- $a: 0$        $b: 1$        $c: 00$

**Q:** What is the issue with the following encoding scheme?

•       $a: 0$        $b: 1$        $c: 00$

**A:** Can not guarantee a unique decoding. For example,  $00$  can be decoded to  $aa$  or  $c$ .

**Q:** What is the issue with the following encoding scheme?

- $a: 0$        $b: 1$        $c: 00$

**A:** Can not guarantee a unique decoding. For example, 00 can be decoded to  $aa$  or  $c$ .

## Solution

Use **prefix codes** to guarantee a unique decoding.

# Prefix Codes

**Def.** A prefix code for a set  $S$  of letters is a function  $\gamma : S \rightarrow \{0, 1\}^*$  such that for two distinct  $x, y \in S$ ,  $\gamma(x)$  is not a prefix of  $\gamma(y)$ .

# Prefix Codes

**Def.** A prefix code for a set  $S$  of letters is a function  $\gamma : S \rightarrow \{0, 1\}^*$  such that for two distinct  $x, y \in S$ ,  $\gamma(x)$  is not a prefix of  $\gamma(y)$ .

$a$	$b$	$c$	$d$
